## PURE MATHEMATICS
### A level Practice Papers

(2 marks)

1. States that \( \cot 3x = \frac{\cos 3x}{\sin 3x} \)

   - Makes an attempt to find \( \int \left( \frac{\cos 3x}{\sin 3x} \right) \, dx \)

   - Writing \( \int f'(x) \, dx = \ln[f(x)] \) or writing \( \ln(\sin x) \) constitutes an attempt.

   - States a fully correct answer: \( \frac{1}{3} \ln|\sin 3x| + C \)

   **TOTAL:** 3 marks

2. Begins the proof by assuming the opposite is true.

   - ‘Assumption: there exists a rational number \( \frac{a}{b} \) such that \( \frac{a}{b} \) is the greatest positive rational number.’

   - Makes an attempt to consider a number that is clearly greater than \( \frac{a}{b} \):

     - ‘Consider the number \( \frac{a}{b} + 1 \), which must be greater than \( \frac{a}{b} \).’

   - Simplifies \( \frac{a}{b} + 1 \) and concludes that this is a rational number.

     \[
     \frac{a}{b} + 1 = \frac{a + b}{b} = \frac{a + b}{b}
     \]

     By definition, \( \frac{a + b}{b} \) is a rational number.

   - Makes a valid conclusion.

     This contradicts the assumption that there exists a greatest positive rational number, so we can conclude that there is not a greatest positive rational number.

   **TOTAL:** 4 marks

### MARK SCHEME

- M1: States that \( \cot 3x = \frac{\cos 3x}{\sin 3x} \)

- M1: Makes an attempt to find \( \int \left( \frac{\cos 3x}{\sin 3x} \right) \, dx \)

- A1: States a fully correct answer: \( \frac{1}{3} \ln|\sin 3x| + C \)

- B1: Begins the proof by assuming the opposite is true.

- M1: Makes an attempt to consider a number that is clearly greater than \( \frac{a}{b} \):

- M1: Simplifies \( \frac{a}{b} + 1 \) and concludes that this is a rational number.

- B1: Makes a valid conclusion.

This contradicts the assumption that there exists a greatest positive rational number, so we can conclude that there is not a greatest positive rational number.
M1

States a fully correct answer: \( \int \sin 4x(1 - \cos 4x)^3 \, dx = \frac{1}{16}(1 - \cos 4x)^4 + C \)

M1 ft

Correctly states answer is \( \frac{15}{256} \)

TOTAL: 4 marks

M1

Correctly factors each expression on the left-hand side of the identity:

\[
\begin{align*}
(x - 6)(x + 6) & \quad (5x + x)(5 - x) \\
(x - 5)(x - 6) & \quad Ax^2 + Bx + C \\
& \quad (3x - 1)(2x + 3) \\
& \quad (3x - 1)(x + 6)
\end{align*}
\]

M1

Correctly states or implies that \( A = 2, \; B = -9 \) and \( C = -18 \)

TOTAL: 5 marks

NOTES: Alternative method

M1

Makes an attempt to substitute \( x = 0 \)

A1

Finds \( C = -18 \)

M1

Substitutes \( x = 1 \) to give \( A + B = -7 \)

M1

Substitutes \( x = -1 \) to give \( A - B = 11 \)

A1

Solves to get \( A = 2, \; B = -9 \) and \( C = -18 \)
| 5 | Begins the proof by assuming the opposite is true.  
   ‘Assumption: there exists a number $n$ such that $n$ is odd and $n^3 + 1$ is also odd.’ | B1 |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Defines an odd number: ‘Let $2k + 1$ be an odd number.’</td>
<td>B1</td>
</tr>
</tbody>
</table>
| | Successfully calculates $(2k + 1)^3 + 1$  
   $(2k + 1)^3 + 1 = (8k^3 + 12k^2 + 6k + 1) + 1 = 8k^3 + 12k^2 + 6k + 2$ | M1 |
| | Factors the expression and concludes that this number must be even.  
   $8k^3 + 12k^2 + 6k + 2$  
   $2(4k^3 + 6k^2 + 3k + 1)$ is even. | M1 |
| | Makes a valid conclusion.  
   This contradicts the assumption that there exists a number $n$ such that $n$ is odd and $n^3 + 1$ is also odd, so if $n$ is odd, then $n^3 + 1$ is even. | B1 |
| | TOTAL: 5 marks | | 

**NOTES: Alternative method**

Assume the opposite is true: there exists a number $n$ such that $n$ is odd and $n^3 + 1$ is also odd. (B1)  
If $n^3 + 1$ is odd, then $n^3$ is even. (B1)  
So 2 is a factor of $n^3$. (M1)  
This implies 2 is a factor of $n$. (M1)  
This contradicts the statement $n$ is odd. (B1)

| 6a | Understands that for the series to be convergent $|r| < 1$ or states $|4x| < 1$ | M1 |
|---|---|---|
| | Correctly concludes that $|x| < \frac{1}{4}$.  
   Accept $-\frac{1}{4} < x < \frac{1}{4}$ | A1 |
| | TOTAL: 5 marks | | 

| 6b | Understands to use the sum to infinity formula.  
   For example, states $\frac{1}{1 + 4x} = 4$ | M1 |
|---|---|---|
| | Makes an attempt to solve for $x$.  
   For example, $4x = -\frac{3}{4}$ is seen. | M1 |
| | States $x = -\frac{3}{16}$ | A1 |
| | TOTAL: 5 marks | |
### 7

<table>
<thead>
<tr>
<th>States $-a + b = 10$ and $7a + 5b = 2$</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Makes an attempt to solve the pair of simultaneous equations. Attempt could include making a substitution or multiplying the first equation by 5 or by 7.</td>
<td>M1</td>
</tr>
<tr>
<td>Finds $a = -4$</td>
<td>A1</td>
</tr>
<tr>
<td>Finds $b = 6$</td>
<td>A1</td>
</tr>
<tr>
<td>States $-2abc = -96$</td>
<td>M1</td>
</tr>
<tr>
<td>Finds $c = -2$</td>
<td>A1</td>
</tr>
</tbody>
</table>

**TOTAL:** 6 marks

### 8

<table>
<thead>
<tr>
<th>Understands the need to complete the square, and makes an attempt to do this.</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>For example, $(x - 4)^2$ is seen.</td>
<td></td>
</tr>
<tr>
<td>Correctly writes $g(x) = (x - 4)^2 - 9$</td>
<td>A1</td>
</tr>
<tr>
<td>Demonstrates an understanding of the method for finding the inverse is to switch the $x$ and $y$. For example, $x = (y - 4)^2 - 9$ is seen.</td>
<td>B1</td>
</tr>
<tr>
<td>Makes an attempt to rearrange to make $y$ the subject. Attempt must include taking the square root.</td>
<td>M1</td>
</tr>
<tr>
<td>Correctly states $g^{-1}(x) = \sqrt{x + 9} + 4$</td>
<td>A1</td>
</tr>
<tr>
<td>Correctly states domain is $x &gt; -9$ and range is $y &gt; 4$</td>
<td>B1</td>
</tr>
</tbody>
</table>

**TOTAL:** 6 marks
Makes an attempt to set up a long division.

For example: \( 9x^2 + 0x - 16 \) is seen.

The ‘0x’ being seen is not necessary to award the mark.

Long division completed so that a ‘1’ is seen in the quotient and a remainder of \( 25x + 32 \) is also seen.

\[
\begin{array}{rccc}
9x^2 + 0x & 16 & 9x^2 + 25x + 16 \\
9x^2 + 0x & 16 & 9x^2 + 25x + 16 \\
& & 25x + 32 \\
\end{array}
\]

States \( B(3x + 4) + C(3x - 4) = 25x + 32 \)

Equates the various terms.

Equating the coefficients of \( x \): \( 3B + 3C = 25 \)
Equating constant terms: \( 4B - 4C = 32 \)

Multiplies one or both of the equations in an effort to equate one of the two variables.

Finds \( B = \frac{49}{6} \)

Finds \( C = \frac{1}{6} \)

TOTAL: 7 marks

NOTES: Alternative method

Writes \( A + \frac{B}{3x + 4} + \frac{C}{3x - 4} \) as \( \frac{A(3x - 4)(3x + 4)}{9x^2 - 16} + \frac{B(3x + 4)}{9x^2 - 16} + \frac{C(3x - 4)}{9x^2 - 16} \)

States \( A(3x - 4)(3x + 4) + B(3x + 4) + C(3x - 4) = 9x^2 + 25x + 16 \)

Substitutes \( x = \frac{4}{3} \) to obtain: \( 8B = \frac{196}{3} \) \( B = \frac{49}{6} \)

Substitutes \( x = \frac{4}{3} \) to obtain: \( 8C = \frac{4}{3} \) \( C = \frac{1}{6} \)

Equating the coefficients of \( x^2 \): \( 9A = 9 \) \( A = 1 \)
<table>
<thead>
<tr>
<th></th>
<th>States that $\sin \theta = \frac{BD}{1}$ and concludes that $BD = \sin \theta$</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>States that $\cos \theta = \frac{AD}{1}$ and concludes that $AD = \cos \theta$</td>
<td>M1</td>
</tr>
<tr>
<td></td>
<td>States that $DBC = \ldots$</td>
<td>M1</td>
</tr>
<tr>
<td></td>
<td>States that $\tan \theta = \frac{DC}{\sin \theta}$ and concludes that $DC = \frac{\sin^2 \theta}{\cos \theta}$ oe.</td>
<td>M1</td>
</tr>
<tr>
<td></td>
<td>States that $\cos \theta = \frac{\sin \theta}{BC}$ and concludes that $BC = \tan \theta$ oe.</td>
<td>M1</td>
</tr>
<tr>
<td></td>
<td>Recognises the need to use Pythagoras’ theorem. For example, $AB^2 + BC^2 = AC^2$</td>
<td>M1</td>
</tr>
<tr>
<td></td>
<td>Makes substitutions and begins to manipulate the equation: $1 + \tan^2 \theta = \left(\frac{\cos \theta}{1} + \frac{\sin^2 \theta}{\cos \theta}\right)^2$</td>
<td>M1</td>
</tr>
<tr>
<td></td>
<td>Uses a clear algebraic progression to arrive at the final answer: $1 + \tan^2 \theta = \left(\frac{1}{\cos \theta}\right)^2$</td>
<td>A1</td>
</tr>
<tr>
<td></td>
<td>$1 + \tan^2 \theta = \sec^2 \theta$</td>
<td></td>
</tr>
</tbody>
</table>

**TOTAL:** 8 marks
### 11a
States \( \sin t = \frac{x + 4}{7} \) and \( \cos t = \frac{y - 3}{7} \)  
- Recognises that the identity \( \sin^2 t + \cos^2 t = 1 \) can be used to find the cartesian equation.  
- Makes the substitution to find \( (x + 4)^2 + (y - 3)^2 = 7^2 \)  

(3 marks)

### 11b
States or implies that the curve is a circle with centre \((-4, 3)\) and radius 7  
- Substitutes \( t = -\frac{\pi}{2} \) to find \( x = -11 \) and \( y = 3 \) \((-11, 3)\)  
- Substitutes \( t = \frac{\pi}{3} \) to find \( x \approx 2.06 \) and \( y = 6.5 \) \((2.06, 6.5)\)  
- Could also substitute \( t = 0 \) to find \( x = -4 \) and \( y = 10 \) \((-4, 10)\)

(3 marks)

### 11c
- Makes an attempt to find the length of the curve by recognising that the length is part of the circumference. Must at least attempt to find the circumference to award method mark.  
  \[ C = 2 \times \pi \times 7 = 14\pi \]  
- Uses the fact that the arc is \( \frac{5}{12} \) of the circumference to write:  
  \[ \text{arc length} = \frac{35}{6} \pi \]  

(2 marks)

**TOTAL:** 8 marks

**NOTES:**
- **11b** Award ft marks for correct sketch using incorrect values from part a.
- **11c** Award ft marks for correct answer using incorrect values from part a.
- **11c** Alternative method: use \( s = r\theta \), with \( r = 7 \) and \( \theta = \frac{5\pi}{6} \).  
  Award one mark for the attempt and one for the correct answer.
### 12a
Finds \( \frac{dx}{dt} = -2\sin 2t \) and \( \frac{dy}{dt} = \cos t \)

| M1 |

Writes \(-2\sin 2t = -4\sin t \cos t\)

| M1 |

Calculates \( \frac{dy}{dx} = \frac{\cos t}{-4\sin t \cos t} = -\frac{1}{4} \csc t \)

| A1 |

(3 marks)

### 12b
Evaluates \( \frac{dy}{dx} \) at \( t = -\frac{5\pi}{6} \)

\[
\frac{dy}{dx} = \frac{1}{4\sin\left(-\frac{5\pi}{6}\right)} = \frac{1}{2}
\]

| A1 ft |

Understands that the gradient of the tangent is \( \frac{1}{2} \), and then the gradient of the normal is \(-2\)

| M1 ft |

Finds the values of \( x \) and \( y \) at \( t = -\frac{5\pi}{6} \)

\[
x = \cos\left(2 \times -\frac{5\pi}{6}\right) = \frac{1}{2}
\]

\[
y = \sin\left(-\frac{5\pi}{6}\right) = -\frac{1}{2}
\]

| M1 ft |

Attempts to substitute values into \( y - y_1 = m(x - x_1) \)

For example, \( y + \frac{1}{2} = -2\left(x - \frac{1}{2}\right) \) is seen.

| M1 ft |

Shows logical progression to simplify algebra, arriving at:

\[
y = -2x + \frac{1}{2} \text{ or } 4x + 2y -1 = 0
\]

| A1 |

(5 marks)

TOTAL: 8 marks

### NOTES: 12b
Award ft marks for a correct answer using an incorrect answer from part a.
13a

Attempts to sketch both \( y = \frac{2}{x} \) and \( y = e^x \).

States that \( y = \frac{2}{x} \) meets \( y = e^x \) in just one place, therefore \( \frac{2}{x} = e^x \) has just one root \( \Rightarrow \) \( g(x) = 0 \) has just one root.

(2 marks)

13b

Makes an attempt to rearrange the equation. For example, \( e^x = 0 \) \( \Rightarrow xe^x = 2 \).

Shows logical progression to state \( x = 2e^{-x} + 1 \).

For example, \( x = \frac{2 + e^x}{e^x} \) is seen.

(2 marks)

13c

Attempts to use iterative procedure to find subsequent values.

Correctly finds: \( x_1 = 1.4463 \) \( x_2 = 1.4709 \) \( x_3 = 1.4594 \) \( x_4 = 1.4647 \).

(2 marks)

13d

Correctly finds \( g(x) = \frac{2}{(x-1)^2}e^x \).

Finds \( g(1.5) = 0.4816... \) and \( g(1.5) = 12.4816... \).

Attempts to find \( x_1 \): \( x_1 = x_0 - \frac{g(x_0)}{g'(x_0)} \Rightarrow x_1 = 1.5 - \frac{-0.4816...}{-12.4816...} \).

Finds \( x_1 = 1.461 \).

(4 marks)

TOTAL: 10 marks
NOTES:

13a

Uses their graphing calculator to sketch \( g(x) = \frac{2}{x} + e^x \)  \( \text{(M1)} \)

States that as \( g(x) \) only intersects the \( x \)-axis in one place, there is only one solution.  \( \text{(A1)} \)

13c

Award M1 if finds at least one correct answer.
14a Writes: \( \frac{1+x}{\sqrt{1-2x}} \) as \((1+x)(1-2x)^{\frac{1}{2}}\) \[ M1 \]

Uses the binomial expansion to write: \((1-2x)^{-\frac{1}{2}} = 1 + \left(-\frac{1}{2}\right)(-2x) + \left(-\frac{3}{2}\right)(-2x)^2 + ...\) \[ M1 \]

Simplifies to obtain: 
\[(1+x)(1-2x)^{\frac{1}{2}} = (1+x) \left(1 + x + \frac{3}{2}x^2\right)\] \[ M1 \]

Writes the correct final answer: 
\[1 + 2x + \frac{5}{2}x^2 \ldots\] \[ A1 \text{ ft} \]

(4 marks)

14b Either states \( |x| < \frac{1}{2} \) or states \( \frac{1}{2} < x < \frac{1}{2} \) \[ B1 \]

(1 mark)

14c Makes an attempt to substitute \( x = \frac{1}{100} \) into \( \frac{1+x}{\sqrt{1-2x}} \) \[ M1 \]

For example: 
\[ \frac{1 + \frac{1}{100}}{\sqrt{1-2\left(\frac{1}{100}\right)}} = \frac{101}{100} \div \sqrt{98} \]

Continues to simplify the expression: 
\[ \frac{101}{100} \div \sqrt{98} \] And states the correct final answer: 
\[ \frac{101\sqrt{2}}{140} \] \[ A1 \]

(2 marks)

14d Substitutes \( x = \frac{1}{100} \) into \( 1 + 2x + \frac{5}{2}x^2 \) Obtains: 
\[ 1 + 2\left(\frac{1}{100}\right) + \frac{5}{2}\left(\frac{1}{100}\right)^2 \approx 1.02025 \] \[ M1 \text{ ft} \]

States that \( 1.02025 \cdot \frac{101\sqrt{2}}{140} \) \[ M1 \text{ ft} \]

Deduces that \( \sqrt{2} \approx \frac{140 \times 1.02025}{101} \approx 1.41421 \) \[ A1 \text{ ft} \]

(3 marks)

TOTAL: 10 marks

NOTES:

14a Award 3 marks if a student has used an incorrect expansion but worked out all the other steps correctly.

14d Award all three marks if a student provided an incorrect answer in part a, but accurately works out an approximation for root 2 consistent with this incorrect answer.
